Summary

Full stack engineer at TotalEnergies Staff Housing Cooperative (TEHC) and ACUOP in Lagos, building finance software: an expense system that handles about 80 claims a month, averaging ₦10 million in transaction volume, and a loan and mortgage calculator API live with six products for property developers. In 2026 I merged 205 pull requests across six repositories, including 18 production releases in three weeks. Most of what I build moves money or decides who sees what, so I put the rules first.

Technical Skills

Languages: TypeScript, JavaScript, Python, C#, SQL
Frontend: React, Next.js (App Router, Server Actions), React Native (Expo), Three.js (React Three Fiber), TanStack Query, Zustand, React Hook Form, Zod, Tailwind CSS
Backend: Node.js, Express, FastAPI, ASP.NET Core, SignalR, WebSockets, REST, OpenAPI
Databases: PostgreSQL, Supabase (RLS, RPCs, Edge Functions), Prisma, Alembic, EF Core, MongoDB, IndexedDB (Dexie)
Auth & Security: JWT with rotating refresh tokens, CSRF protection, OTP sign in, RBAC, API keys, rate limiting, audit logs
Testing: Vitest, pytest, xUnit, Supertest, React Testing Library, Playwright, mypy, Ruff
Integrations: Paystack, Dynamics 365 Business Central, Gemini, OpenAI Vision, Claude API, Deepgram, ElevenLabs, ZeptoMail

Experience

TotalEnergies Staff Housing Cooperative (TEHC), Lagos — *Oct 2025 to Present*
Software Engineer & IT Systems Administrator · *Technical and Innovation team, reporting to the COO*

Expense Tracker *Next.js 16, Supabase, Dynamics 365 Business Central*

- Handles about 80 claims a month, averaging ₦10 million in transaction volume. About 50 staff raise claims against the chart of accounts with a live budget check; approvals route by department and level, Accounts checks VAT and withholding tax, Treasury pays, the COO approves budgets, and every paid claim posts to Dynamics 365 Business Central.
- Authorization lives in Postgres through row level security and RPCs that reject illegal state changes, so a check skipped in the UI still fails in the database. Edge Functions sync vendors from Business Central over OAuth2 every six hours, send ZeptoMail email and read receipts with Gemini OCR, so staff no longer type figures by hand.
- Merged 22 pull requests in under two weeks for Finance and Treasury: beneficiary banks from a Paystack mirrored list, entity splits that Accounts can correct in review, a collated payment schedule emailed to Accounts and Treasury, Excel exports and a live status tracker for staff.

ACUOP, Lagos — *Jan 2026 to Present*
Web Systems Administrator & Software Developer

Loan Calculator Platform *FastAPI, PostgreSQL, Alembic, Azure App Service*

- Top contributor to the calculator API that prices ACUOP's loans and mortgages, live with ACUOP as its first financier and six loan products that property developers call with their own API keys. Merged 135 pull requests in six weeks and shipped 18 production releases in three.
- Wrote the amortization engine in pure Python with Decimal money and no database, clock or network access. It handles staged drawdowns tied to construction milestones, a repayment that never drops below its peak, overpayments credited to the next milestone, moratoriums and an exact final payment, and golden file tests hold it to Finance's spreadsheets.
- Designed the three tier tenancy (system, financier, project): invite only onboarding, a two signature approval bound to a content hash so an approved rate cannot quietly change, per project API keys, idempotent writes and an append only audit trail across 90 endpoints.
- Kept it releasable with 1,645 tests behind a 90% coverage floor, mypy, an import linter that isolates the engine, an OpenAPI snapshot check and a generated TypeScript client that fails CI on drift. Merges to main migrate and deploy to Azure.

Member Portal *React 19, TypeScript, TanStack Query, Zustand*

- Set up the codebase and built the multi step membership application (validation, joint owners, prefill for Louisville clients) that has onboarded 80 members, with BVN and NIN verified through Qore.id.
- Merged 37 pull requests in all, including the member dashboard, shares and profile, the Relationship Manager module, and the admin projects, products, transactions and analytics screens.

Drevad Ltd. (UK), Remote *Jan 2025 to Mar 2025*

Software Engineering Intern

Online store *React, Vite, Node.js, Express, PostgreSQL, Paystack*

- Built the store end to end on my own: catalog, cart, coupons, reviews, wishlist, checkout, order management and an admin dashboard with separate super, sales and finance permissions.
- Integrated Paystack with a settlement flow that confirms each payment through both the webhook and the client, checks the amount on the server and ignores repeats, so no customer is charged or fulfilled twice.
- Replaced long lived tokens with short JWTs, rotating httpOnly refresh cookies and CSRF protection, so logging out really ends the session. Added CSV bulk import with per row validation, Helmet, rate limiting, Sentry, and Vitest and Supertest suites around payments, coupons and auth.

Selected Projects

MYDROBE, 3D virtual wardrobe in the browser, in development

React 19, TypeScript, Three.js (React Three Fiber), Web Workers, IndexedDB (Dexie), Zustand, Vitest, Playwright

- Turns a photo of your own shirt or trousers into a garment on a 3D mannequin, with no account, backend or paid AI. A web worker cuts the garment from its background, and FFT autocorrelation finds the repeat in checks and plaids so the back and sleeves tile seamlessly.
- Took it from first commit to a working MVP in four days: 232 commits across 34 pull requests, 346 unit tests, and a Playwright journey that reads the rendered WebGL pixels and confirms no photo leaves the device.

Mr Feranmi, voice based mock interviewer, hackathon build

Next.js 16, TypeScript, Supabase, Claude API, Deepgram, ElevenLabs

- Candidates speak their answers and hear the interviewer reply. One model runs live turns through a strict tool schema; a second scores at the end and must quote the transcript for every score.
- Model and speech calls stay on the server and the marking scheme never reaches the browser. Sessions persist under RLS and survive a refresh or restart.

Spinmedical, medical crowdfunding platform

Next.js, TypeScript, Prisma, PostgreSQL, Auth.js

- Donors pay into one shared pool and a weighted draw, based on urgency and time waiting, pays a verified patient's bill in full. Each draw stores its seed and candidate list, so any past result can be recomputed and audited.
- Pool balance is derived from the ledger rather than a cached counter, money is stored in kobo, and five roles cover patients, helpers, donors, verifiers and admins. Built around Nigeria's NDPA.

Tickety, real time IT support desk

ASP.NET Core (.NET 10), SignalR, EF Core, PostgreSQL, React, TypeScript, xUnit, Docker

- Ticket lifecycle enforced by a unit tested domain state machine on the server, so invalid transitions are rejected whatever the client sends. Invite only sign up, three roles, full event history.
- Two SignalR hubs push new tickets to agents and status changes to anyone viewing, with the JWT verified on the WebSocket handshake. The API ships as a Docker container on Render.

HOCKS, real time multiplayer air hockey

TypeScript, Node.js, WebSockets, Vite, Vitest, Docker, Render, Fly.io

- Authoritative 60Hz server with a deterministic fixed timestep simulation, snapshot interpolation, client side prediction and server reconciliation, so your own paddle responds instantly at a 240ms round trip.
- A self sizing interpolation buffer cut opponent lag from Lagos to Frankfurt from about 220ms to 155ms. Deployed to two regions and measured through a live overlay of RTT, jitter and replayed ticks.

Jada Finds, live client site for a Lagos personal shopper

HTML, CSS, JavaScript, Netlify Forms

- A tested fee calculator and invoice builder give clients a price before they commit. The request form takes up to five reference photos, budget and sizes, saves the enquiry, then opens WhatsApp with the details already filled in.

Education & Certifications

B.Sc. Educational Technology, University of Ilorin, Nigeria · 2024 · CGPA 4.0 / 5.0

CS50 Web Programming with Python and JavaScript, Harvard University · Microsoft Azure Fundamentals · Backend Development with Django · Web Scraping with Python · Cloud Security Fundamentals
